Satellite Images Show Damage at Iranian Nuclear Sites

The United States struck three key nuclear sites in Iran overnight on Saturday. Pentagon officials said on Sunday that the sites had sustained “extremely severe damage and destruction.”

Where the U.S. attacked Iran

American strikes Israeli strikes since June 13

Officials said that seven American warplanes had dropped multiple 30,000-pound bunker-busters on the Fordo nuclear site, as well as facilities at Natanz. A Navy submarine also fired more than two dozen cruise missiles at a third site, Isfahan.

Officials said it was too soon to know whether Iran still retained the ability to make a nuclear weapon, and that the location of its existing stockpile of enriched uranium was unknown.

Satellite images analyzed by The New York Times show the extent of damage at the three nuclear facilities hit by the United States.

Fordo

Fordo is Iran's most critical nuclear enrichment facility, housed deep inside a mountain to shield it from attacks.

New satellite images taken shortly after the U.S. strikes on Fordo reveal damage and likely entry points for the American bunker-buster bombs. The images show distinct changes in the ground's appearance and gray

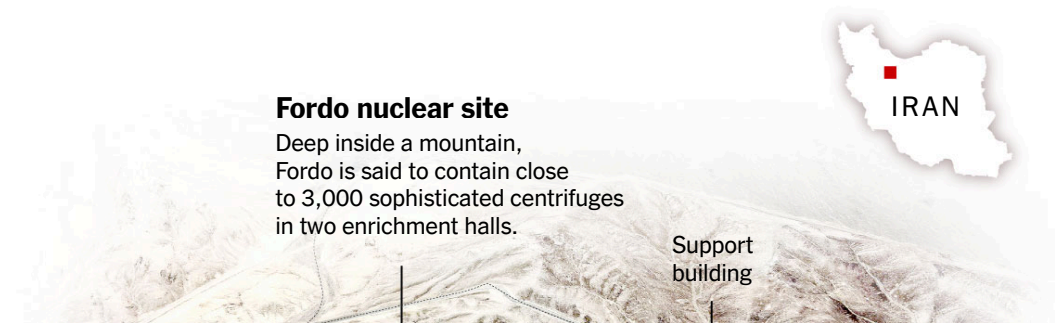

dust near the possible strike locations.

A senior U.S. official acknowledged that the American strike on the Fordo site had not destroyed the heavily fortified facility but said that the strike had severely damaged it, taking it “off the table.” The person noted that even a dozen bunker-busting bombs could not destroy the site.

A New York Times analysis of satellite images shows that the United States targeted Fordo at the precise locations of two structures that experts said might be ventilation shafts.

An Iranian lawmaker said in a post on social media that the site was evacuated “a long time ago” in anticipation of attacks.

Natanz

Natanz, the site of Iran’s largest uranium enrichment center, had previously been damaged in multiple strikes by the Israeli military. The U.S. strike appears to have targeted the complex’s underground enrichment halls, according to satellite images from June 22, which show two craters over the suspected location of those facilities.

Aboveground structures at Natanz were damaged on June 13, the first day of Israel's strikes. The International Atomic Energy Agency said three days later that the strikes had destroyed the electrical infrastructure at the plant, and that the loss of power might have also damaged the centrifuges there.

Isfahan

Near-bomb-grade nuclear fuel is thought to be stored at a complex outside the ancient capital of Isfahan. New satellite images taken after the U.S. strikes show damage to several aboveground structures across the site.

International inspectors viewed supplies of fuel at the complex as recently as two weeks ago, though it was unclear whether Iran moved those supplies in recent days, as some Iranian officials suggested.

If the damage is severe, it may delay the Iranian nuclear program by years, unless undetected parallel facilities exist.

The Israeli military had previously struck laboratories at the facility that work to convert uranium gas into the form that would be needed to actually produce a weapon. Israeli fighter jets struck the facility again on June 21, before the U.S. bombing, according to the Israeli military and a state-affiliated Iranian news agency.
